University of Dhaka.

Subject: Prayer for permission for project approval.

Sir,
By referring to the above matter, we would like to present the Project Proposal document. The main purpose for this proposal is to explain the project idea thoroughly. We hope that you will give your suggestions after going through the document. Please notice for any sort of modification.

Your cooperation is really appreciated.

Sincerely yours,

Md. Tahmidur Rahman Khan

1. Introduction

Agriculture has been a powerful driver of poverty reduction in Bangladesh since 2000. It is accounted for reducing poverty by 90 percent between 2005 and 2010. [1] The total land area of Bangladesh is 14.3 million hectares but only 59.8% of it is available for cultivation. [2] The population in the country is increasing rapidly and so the agricultural land is declining in an alarming rate. Also, frequent uses of the land cause the nutrient balance to get deteriorated. So, it is imperative to maintain the nutrient balance of the soil by fertilizing it appropriately. Also, the soil has to be utilized to grow ample crops for the vast population.

The soil samples are collected by the soil surveyors of the country so that the soil specialists can acquire information about the soil. The information is then used to know about the suitable crops for the land. The soil surveyors record the sample data manually on their "sample collection form" during the collection of the samples. It can often lead to errors and becomes tiresome to input the data in the database.

The software project 'Fertilizer Guide' will guide a farmer to use adequate amount of fertilizer based on his/her region. The software will also suggest him/her the best crops to grow for his/her region. Also, this project will let the soil surveyors of the country to record soil sample data easily as their "sample collection form" will be managed by the software.

2. Background Study and Rationale

As population in the country is increasing at an alarming rate, the agricultural land is declining rapidly. During the last decade of 80's, only 15 percent of land in rural areas were being used as non-agricultural activities. But now, it has been increased to 30%. During 1983-1984 the total cultivated area was 20 million 238 thousand acres. But in 1996, it has been decreased to 17 million 449 thousand acres. The cultivating land has been decreasing, on average, at the rate of about 1% during the last 12 years. Also, it was observed that 35% land of the country is very good for agricultural crop production, 40% is average type while 25% land is less suitable for agricultural crop production. [2]

Land of Bangladesh is divided into 30 agro-ecological zones (AEZ) according to soil type, hydrology, physiography, cropping patterns and seasons. These 30 zones have been subdivided into 88 agro-ecological sub-regions. The 88 sub-regions have been further subdivided into 535 agro-ecological units. Different land has different cropping patterns. So, the ecological characteristics has to be kept in mind to get sufficient agricultural productions.

The soil surveyors of the country collect soil samples from various regions. For each sample, they have to record sample number, location, date, time and other information in a "sample collection form" manually. This sample is later examined by a soil specialist. He/she can obtain information from the sample and the data can be used for various purposes like researching, finding out the suitable crops for that soil etc. So, any flaw during the collection of the sample can cause a serious problem.

Technologies are being used to reduce the flaws of the agricultural production system. There are some applications available on Internet to provide knowledge to the farmers for cultivating crops in a better way. Most of those provide guidance to them about using the fertilizer properly for a certain crop. Those also provide information about the implementation methodology of the agro-based products. The details of some of those applications have been discussed briefly in the following sub-sections.

1. Agriculture Info App

It is developed by "National Apps Bangladesh" under the Ministry of Agriculture. It provides information on crop cultivation, fisheries and livestock. It also gives details about the implementation methodology, management and maintenance of the agro-based products. But it does not provide any information based on the AEZ.

2. AgriApp

It is an android based application which is developed by "Agriapp". It provides complete information on crop production, protection and all relevant agricultural services. It also does not give any information based on the AEZ.

3. Fertilizer Recommendation Guide

It is a web based application developed by "eGeneration" which provides fertilizer guidance based on AEZ. But it does not recommend the best crops based on the AEZ.

There is no android based application that provides fertilizer guidance according to the AEZ. One of the purposes of this project is to solve this problem. This android application will also give suggestions to the farmers about the crops suitable for their land. This project will also let the soil surveyors record the sample data through the software. Most of the information that they had to fill in the "sample collection form" will be generated by the software. This will make the job for them easier and error-free.

3. Objectives

- This project will help the farmers to utilize the land by using fertilizers properly.
- It will suggest the farmers the best crops to cultivate based on his/her region.
- Helping the soil experts by allowing them to calculate nutrient balance sheet.

4. Project Description

- The project will give information about using the fertilizers appropriately to the farmers based on their regions.
- Will provide Nutrient Balance Sheet.
- Show fertilizer recommendation based on location and cropping pattern.

5. Scope of Development

The project will conducted based on the data FRG – 2012.

6. Stakeholders Description

For this project, three stakeholders have been identified. They are: Normal Users, DAE, Soil Experts. A brief description is given about them in the following sub-sections.

1. Normal User

Everyone is a normal user.

2. DAE

DAE are field workers providing necessary guide to the farmers.

3. Soil Expert

Soil Experts conduct various research on soil.
